Flora accompanying *Prunus ledebouriana* (Schltdl.) Y.Y.Yao in the Tarbagatai State National Park in Kazakhstan

Abstract. The current state of the *Prunus ledebouriana* (Schltdl.) Y.Y. Yao population growing at various altitudes on the shrub and steppe belts of the Tarbagatai ridge and its species composition were studied. The methods of floristic composition analysis were applied for the first time. The complete composition of accompanying species including *Prunus ledebouriana* was studied on the territory of Tarbagatai State National Park. The originality of this work was in creation of a distribution map for the *Prunus ledebouriana* population. Samples collected in the park from various sources were used as material. The results are presented in the form of a list including 511 species (52 families) that grow together with *Prunus ledebouriana* in this area. The leading families in terms of species number: *Asteraceae* Dumort. (75 species/ 35.2%), *Fabaceae* Lindl. (56 species/ 40.8%), *Poaceae* Barnhart. (52 species/ 32.5%), *Rosaceae* Juss. (43 species/ 44.3%), and *Ranunculaceae* Juss (39 species/ 50%). Species diversity of the families: *Asteraceae* Dumort. 22%, *Fabaceae* Lindl. 17%, *Poaceae* Barnhart. 16%, *Rosaceae* Juss. 13%, *Ranunculaceae* Juss. 12%, *Brassicaceae* Burnett. 7%, *Apiaceae* Lindl. 7%, and *Scrophulariaceae* Juss. 6% of all species growing with *Prunus ledebouriana*. The results of research can be used for species identification and organization of conservation activities for the rare plant species *Prunus ledebouriana*. The studied herbarium samples of *Prunus ledebouriana* (Institute of plant biology and biotechnology, Almaty, Kazakhstan) were transferred to the herbarium fund of the Institute of Botany and Phytointroduction (Almaty, Kazakhstan).

Key words: Tarbagatai ridge, endemic species, shrub, cenopopulation, floristic composition.

Introduction

Organization of specially protected natural areas (SPNA) network is the most effective activity for the preservation of rare, endangered species, unique and virgin areas of nature in the East Kazakhstan [1]. Tarbagatai State National Park was founded on the territory of the Tarbagatai ridge in the East Kazakhstan region (EKR), on the border with the Xinjiang Uygur Autonomous Region of China [2, 3] in accordance with the Resolution No. 382 of the Government of the Republic of Kazakhstan dated from June 27, 2018 [4]. Tarbagatai State National Park is located in the semi-desert landscape of the temperate zone, and it is part of the Tarbagatai physical-geographical province of the Saur-Tarbagatai physical-geographical region of the Dzungar-Saur-Tarbagatai mountainous country [5].

Nowadays, the flora of the Tarbagatai ridge is represented by about 1,640 plant species. The species

composition changes vertically. The southern slope of the Tarbagatai ridge consists of desert-steppe sub-belt – 500-700 m; steppe belt – 700 (600) – 1000 (1200) m; shrubs belt – 1000 (1200) – 1700 (1800) m; subalpine belt – 1700 (1800) -2400 m; and alpine belt – 2400-3100 m. The flora of Tarbagatai ridge is still poorly studied; the information on the plant species diversity of this region was presented in the work of E.F. Stepanova [6]. According to the natural scientific substantiation of 2014, species on the studied territory belong to 80 families and 504 genera including 14 species of ferns (0.9%), 4 species of horsetails (0.2%), 6 species of gymnosperms (0.4 %), 334 species of monocotyledons (20.5%) and 1269 species of dicotyledons (78%); 169 species of them are endemic plants [7].

A rare, endemic, and ornamental shrub Ledebour almond (*Prunus ledebouriana* (Schltdl.) Y.Y.Yao) (Figure 1) of the family *Rosaceae* grows on the park

territory and forms large stripes and thickets in the central part of the Tarbagatai ridge's southern slope [8].

Amygdalus ledebouriana Schltdl. was discovered and identified for the first time by German botanists Schlechtendahl. The first information about this species was published in 1854: Abhandlungen der Naturforschenden Gesellschaft zu Halle 2 [9]. This species was presented in the tenth volume of "Flora of the USSR" [10], in the fourth volume of "Flora of Kazakhstan" [11], and in the first part of the "Illustrated guide of plants in Kazakhstan" [12]. *A. ledebouriana* was included in the "Red Book of the Kazakh SSR" [13], as a rare and endangered plant species. In all of the abovementioned sources, this

plant species is described as a rare and endemic plant species found in East Kazakhstan. The main species trait can be found in generative plants at the fruiting phase and is observed in half-open fruits with a formed pit, the base of which is obliquely drawn [14, 15].

Species name *Prunus ledebouriana* (Schltdl.) Y.Y. Yao is valid and widespread in English sources [16-19], but the synonymous name *Amygdalus ledebouriana* (Ledebour or ledebourian almond) is common for endemic plant species listed in the "Red Book of Central Asia" [20] and "Red Book of the Republic of Kazakhstan" [21]. It has the status of Endangered (EN) (IUCN Red List) according to various world source [22].

Figure 1 – *Prunus ledebouriana* (Schltdl.) Y.Y. Yao, growing along the road near Urjar village (photo by A.E. Orazov, 2020)

The species grows in a meadow or mesoxerophilic steppes, on mountains, steppe slopes and plateaus, in river valleys and in meadow hollows. It occurs in the foothills of the southwestern Altai, Tarbagatai ridge, Dzhungar Alatau. It is found in floristic regions of Kazakhstan under numbers 22 – "Altai" and 23 – "Tarbagatai" (Figure 2).

The studies were carried out on the territory of the Tarbagatai State National Park with the official permission of the organization (permission letter from the director of the

Tarbagatai State National Park Tokymtaev A.B. No 5-182 from 24.06.2020) within the framework of the project AP05131621 "Informational system for molecular-genetic and botanical documentation of wild flora in Kazakhstan" [23] for 2018-2020 by specialists of the Molecular Genetics Laboratory of the Institute of Plant Biology Biotechnology and Biotechnology (IPBB) the Committee of Science of the Ministry of Education and Science of the Republic of Kazakhstan (CS MES RK) (Almaty).

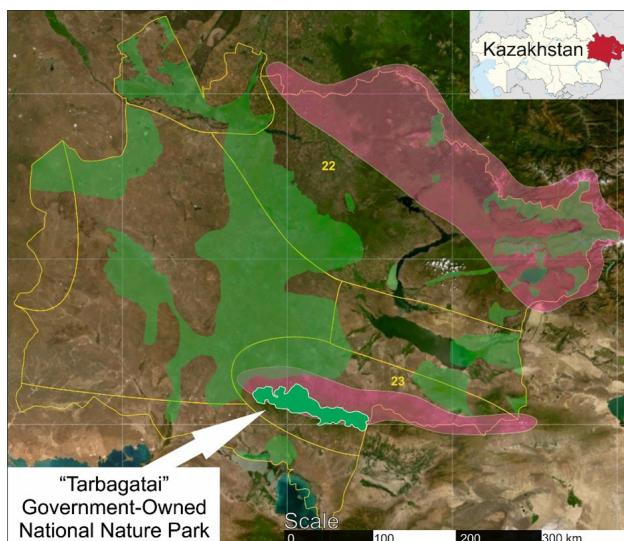

Figure 2 – Google maps Earth view of Geographic location of the Tarbagatai State National Park among SPNA (green) and distribution areas of *Prunus ledebouriana* (pink)

Materials and methods

The generally accepted botanical and floristic methods described in the work of Bykov B.A. [24] were used for the description of plant communities

with the participation and dominance of the studied plant species. The Latin names of these species were checked in various international plant databases [25–28]. Also, classical sources were used in accordance with the rules adopted in the summary of Cherepanov S.K. [29] and Abdulina S.A. [30]. The maps were constructed using ArcMap 10.4 and CorelDRAW 2017 software based on the functional zoning map, projected infrastructure and tourism facilities of the Tarbagatai State National Park ("Tarbagatai Mountains" section). The map of East Kazakhstan from the Google maps service was used as an original (Figure 2).

The survey was carried out according to the route-reconnaissance method [31]. The field research routes were compiled based on cartographic forest management materials of land use, administrative maps of the Urdzhar region, and maps of the Tarbagatai State National Park. The location of thickets was determined using the biological characteristics and ecological confinement of the studied species, as well as using herbarium material from this area. Herbarium fund of higher plants of the Institute of botany and phytointroductions: Tarbagatai ridge, southern slope, Kusak river gorge, 1200 m above sea level, on the western slope, from July 31, 1955 were collected and identified by Stepanova E. and others (Figure 3).

Figure 3 – Herbarium specimens of *Prunus ledebouriana* (collected and identified by A.E. Orazov, J.K. Alemseytova, and Sh.T. Tustubayeva, 2020)

The species names of plants were determined using the "Flora of Kazakhstan" [32], "Illustrated guide to plants of Kazakhstan" [12], "Illustrated

encyclopedia" [33]. Pictures in the nature (Figure 4) were uploaded to the site: www.inaturalist.org [34].

Figure 4 – *Prunus ledebouriana* (Schltdl.) Y.Y. Yao at the fruiting phase near Urjar village
(photo by A.E. Orazov, June 2020)

Seeds and herbarium specimens were transferred to the herbarium fund (Laboratory of higher plants flora) and the seed fund (Laboratory of seed production) of the Institute of Botany and Phytointroduction (Almaty) for the identification and storage. Biological samples were also collected and transferred to the Laboratory of Molecular Genetics of the Institute of Plant Biology and Biotechnology (Almaty) and to the MTA-DE “Lendulet” Evolutionary phylogenomics department of botany (Debrecen, Hungary) for subsequent genetic analysis.

Results and discussion

As a result of the survey in the southern slope of the Tarbagatai ridge, several large coenopopulations of *Prunus ledebouriana* were identified (Table 1).

Individual plants of this species form dense stripes (almonds), heterogeneous along the entire length of the ridge on low-mountain, mid-mountain and high-mountain shrub belts (from 700/800-1200 m to 1700-1800 m).

To identify the species composition, were studied three cenopopulations located on different shrub belts (low-mountain, mid-mountain, high-mountain) at the beginning and middle part of the Tarbagatai range (from south to east).

In the lower part of the southern slope, within 700-1500 m, was occupied by thickets of bushes, mainly *Prunus ledebouriana* (Figure 5), in combination with roses (*Rosa spinosissima* L.), aspen lines (*Populus tremula* L.) and apple thickets (*Malus sieversii* (Ledeb.) M. Roem.) with a well-developed shrub layer of *Rosa spinosissima* and *Prunus ledebouriana*.

Table 1 – Characteristics of the *Prunus ledebouriana* cenopopulations on the south slope

No. CP	Administrative territory	GPS coordinates	Altitude (m)	Habitat
	EKR, Urjar district, neighborhood of Urjar village	47°07'17.4"N 81°39'18.5"E	520	Low-mountain shrub belt
	EKR, Urjar district, neighborhood of Karabuirat village	47.0600554 N; 81.8995046 E	760	Mid-mountain shrub belt
	EKR, Urjar district, neighborhood of Koldenen village	47°15'24.9"N 81°86'39.6"E	862	High-mountain shrub belt

Notes: CP – cenopopulation, EKR – East Kazakhstan region.

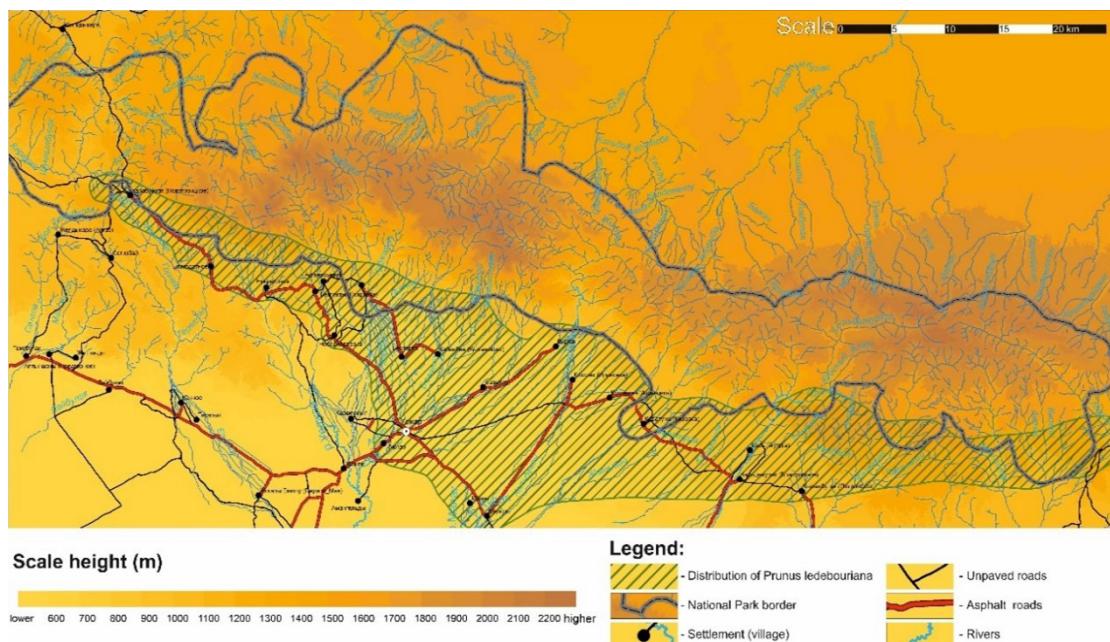

Figure 5 – Distribution of *Prunus ledebouriana* on the territory of the Tarbagatai State National Park

Thickets of shrubs occur on the rocky southern slopes. Here, many individuals of *Atraphaxis laetevirens* Jaub. et Spach, *Calophaca hovenii* Schrenk, and *Spiraea hypericifolia* L. are found in addition to *P. ledebouriana*. Poaceae family in these shrubs is mostly represented by *Bothriochloa ischaemum* (L.) Keng. Meadowsweet and caragana thickets (*Spiraea hypericifolia* L., *S. trilobata* L., *Caragana camilli-schneideri* Kom., *C. frutex* (L.) K. Koch) prevail together with dry steppe's wormwood-turf-grasses communities (*Stipa capillata* L., *S. sareptana* A.K. Becker, *Festuca valesiaca* Schleich. ex Gaudin, *Phleum phleoides* H. Karst., *Artemisia marschalliana* Spreng., *A. sublessingiana* Krasch. ex Poljakov, *A. compacta* Fisch. ex DC., and *Carex pediformis* C.A. Mey.). In the middle mountains, they form a belt at an altitude from 800-900 m to 1350-1450 m above sea level and represent a regular alternation with meadow-steppe and meadow communities. Roses (*R. spinosissima*) with honeysuckle (*Lonicera tatarica* L.), *S. hypericifolia*, *Helictotrichon pubescens* (Huds.) Pilg., *Festuca valesiaca*, and *Artemisia sericea* Weber ex Stechm. prevail in this region. On the southern slopes, they also include *Cotoneaster melanocarpus* Fisch. ex Blytt and *C. oliganthus* Pojark. In the herbaceous layer, mesophytic forbs and grasses prevail (*Bromopsis pumelliana* (Scribn.) Holub, *Bromopsis inermis* (Leyss.) Holub, *Fragaria viridis* (Duch.) Weston, *Lathyrus gmelinii* (Fisch.) Fritsch, *Peucedanum morisonii* Besser ex Schult., and *Thalictrum simplex* L.), *S. hypericifolia*, *F. valesiaca*, *Poa stepposa* (Krylov) Roshev., *Stipa pennata* L., *Helictotrichon desertorum*,

Origanum vulgare L., *Artemisia vulgaris* L., *Thymus stepposus* Klokov & Des.-Shost., and *Medicago falcata* L.

Meadowsweet (*S. hypericifolia*) thickets are common in the intermontane valleys at an altitude of 1200-1300 m together with motley grasses (*H. pubescens*, *Dactylis glomerata* L., *Poa angustifolia* L., *Galium verum* L., and *A. sericea*). Alpine shrubs, usually juniper (*J. sabina*, *J. sibirica*) and meadowsweet (*S. trilobata*, *S. hypericifolia*), grow in the upper belt of mountains together with *C. uniflorus* Bunge shrubs and a grass layer of *Potentilla acaulis* L., *Orostachys spinosa* (L.) Sweet, *Patrinia intermedia* Roem. ex Schult., *Helictotrichon pubescens*, *Helictotrichon desertorum* (Less.) Pilg.

Shrub thickets at the top of the hills are represented by small groups under the rocks with the dominating meadowsweet (*S. trilobata*), *C. uniflorus*, and juniper (*J. sibirica*) with fescue and petrophytic grasses in the lower level (*F. valesiaca*, *S. capillata*, *P. acaulis*). The meadows are occupied by dense meadows and rose hips with honeysuckle (*S. hypericifolia*, *R. spinosissima*, *L. tatarica*); sometimes with the participation of *Padus avium* Mill. and grasses layer (*C. pediformis*, *D. glomerata*, *P. angustifolia*, *Paeonia anomala* L., *F. viridis*). On the edges they are framed by almonds (*P. ledebouriana*). Almonds disappear at the height above 1500-1800 m. As a result of the study of the ridge's shrub belt, an annotated list of plant species growing with *P. ledebouriana* was developed.

The annotated list of plant species growing in the cenopopulation of *Prunus ledebouriana*:

1. Fam. Polypodiaceae Bercht. & J. Presl

In total, 511 accompanying species belonging to 52 families were reviewed: 1. *Polypodiaceae* (2 species), 2. *Equisetaceae* (1 species), 3. *Ephedraceae*

(1 species), 4. *Poaceae* (52 species), 5. *Liliaceae* (21 species), 6. *Amarillidaceae* (1 species), 7. *Iridaceae* (3 species), 8. *Orchidaceae* (2 species), 9. *Salicaceae* (1 species), 10. *Cannabaceae* (1 species), 11. *Urticaceae* (1 species), 12. *Santalaceae* (1 species), 13. *Polygonaceae* (12 species), 14. *Chenopodiaceae* (1 species), 15. *Caryophyllaceae* (26 species), 16. *Paeoniaceae* (2 species), 17. *Ranunculaceae* (39 species), 18. *Berberidaceae* (3 species), 19. *Papaveraceae* (6 species), 20. *Brassicaceae* (24 species), 21. *Crassulaceae* (4 species), 22. *Grossulariaceae* (7 species), 23. *Rosaceae* (44 species), 24. *Fabaceae* (56 species), 25. *Geraniaceae* (1 species), 26. *Rutaceae* (2 species), 27. *Euphorbiaceae* (6 species), 28. *Balsaminaceae* (1 species), 29. *Rhamnaceae* (1 species), 30. *Malvaceae* (3 species), 31. *Hypericaceae* (4 species), 32. *Tamaricaceae* (1 species), 33. *Violaceae* (7 species), 34. *Thymelaeaceae* (1 species), 35. *Lythraceae* (1 species), 36. *Onagraceae* (1 species), 37. *Apiaceae* (24 species), 38. *Primulaceae* (4 species), 39. *Plumbaginaceae* (3 species), 40. *Gentianaceae* (6 species), 41. *Convolvulaceae* (2 species), 42. *Polemoniaceae* (1 species), 43. *Boraginaceae* (9 species), 44. *Lamiaceae* (16 species), 45. *Solanaceae* (2 species), 46. *Scrophulariaceae* (20 species), 47. *Rubiaceae* (4 species), 48. *Caprifoliaceae* (1 species), 49. *Valerianaceae* (1 species), 50. *Dipsacaceae* (2 species), 51. *Campanulaceae* (1 species), 52. *Asteraceae* (75 species). Large families are shown in Table 2 with the numerical and percentage ratios of species growing with *Prunus ledebouriana* from the total number of species growing in the Tarbagatai State National Park.

Table 2 – The ratio of species by families growing together with *Prunus ledebouriana*

No.	Large families	The numerical ratio of species in the family	The percentage of species in the family
	<i>Asteraceae</i>	75/213	35.2
	<i>Fabaceae</i>	56/137	40.8
	<i>Poaceae</i>	52/160	32.5
	<i>Rosaceae</i>	43/97	44.3
	<i>Ranunculaceae</i>	39/78	50
	<i>Brassicaceae</i>	24/104	23
	<i>Apiaceae</i>	24/59	40.6
	<i>Scrophulariaceae</i>	20/53	37.7
	Total:	511/1637	31.2

The numerical and percentage ratios of species growing with *Prunus ledebouriana* from the total number of species growing in the Tarbagatai State National Park was 31.2% (511 species with *Prunus ledebouriana* out of 1637 total species). The accompanying species composition consists of species growing on the low-mountain shrub belt (*Asteraceae*-69 species, *Fabaceae*-47 species, *Poaceae* – 40 species, *Rosaceae* – 30 species, *Ranunculaceae* – 32 species, *Brassicaceae* – 18 species, *Apiaceae* – 24 species, *Scrophulariaceae* – 17 species), mid-mountain shrub belt (*Asteraceae* – 71 species, *Fabaceae* – 56 species, *Poaceae* – 49 species, *Rosaceae* – 43 species, *Ranunculaceae* – 39 species, *Brassicaceae* – 21 species, *Apiaceae* – 24 species, *Scrophulariaceae* – 20 species), high-mountain shrub belt (*Asteraceae* – 18 species, *Fabaceae* – 26 species, *Poaceae* – 18 species, *Rosaceae* – 21 species, *Ranunculaceae* – 14 species, *Brassicaceae* – 9 species, *Apiaceae* – 8 species, *Scrophulariaceae* – 7 species). Family *Asteraceae* – 75 species, *Fabaceae* – 56 species, *Poaceae* – 52 species, *Rosaceae* – 43 species and *Ranunculaceae* – 39 species.

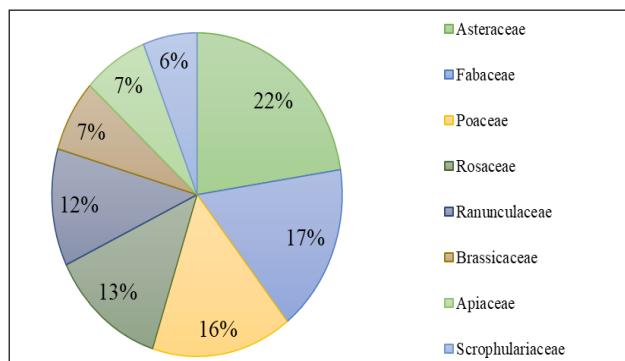

Figure 7 – The percentage of the diversity of species belonging to large families growing with *Prunus ledebouriana* in the territory of the Tarbagatai State National Park.

Figure 7 shows a diagram of the percentage ratio of species diversity from different families growing with *Prunus ledebouriana* on the territory of the Tarbagatai State National Park: *Asteraceae* 22%; *Fabaceae* 17%; *Poaceae* 16%; *Rosaceae* 13%; *Ranunculaceae* 12%; *Brassicaceae* 7%; *Apiaceae* 7% и *Scrophulariaceae* 6%.

Conclusion

Species composition analysis of *P. ledebouriana* cenopopulation on the territory of “Tarbagatai” State

national park and its surroundings showed that the leading group includes widespread species and that the species composition changes vertically. The list of plants is mainly composed of steppe, meadow, rocky and coastal water species. A map has been developed of the distribution of *P. ledebouriana* in the Tarbagatai state National Park and its surroundings

In the lower part of the southern slope, within 700-1500 m, is occupied by thickets of bushes, mainly *P. ledebouriana*, in combination with roses (*Rosa spinosissima*), aspen lines (*Populus tremula*) and apple thickets (*Malus sieversii*) with a well-developed shrub layer of *Rosa spinosissima* and *P. ledebouriana*.

Thickets of shrubs occur on the rocky southern slopes. Here, many individuals of *Atraphaxis laetevirens*, *Calophaca howenii*, and *Spiraea hypericifolia* are found in addition to *Prunus ledebouriana*. Poaceae family in these shrubs is mostly represented by *Bothriochloa ischaemum* Meadowsweet and caragana thickets (*Spiraea hypericifolia*, *S. trilobata*, *Caragana camillischneideri*, *C. frutex*) prevail together with dry steppe's wormwood-turf-grasses communities (*Stipa capillata*, *S. sareptana*, *Festuca valesiaca*, *Phleum phleoides*, *Artemisia marschalliana*, *A. sublessingiana*, *A. compacta*, and *Carex pediformis*).

Shrub thickets (*P. ledebouriana*) at the top of the hills are represented by small groups under the rocks with the dominating meadowsweet (*Spiraea trilobata*), *Cotoneaster uniflorus*, and juniper (*Juniperus sibirica*) with fescue and petrophytic grasses in the lower level (*Festuca valesiaca*, *Stipa capillata*, *Potentilla acaulis*).

On this territory, 511 species representing 52 families grow with *P. ledebouriana*. Families with largest species numbers: *Asteraceae* (75 species), *Fabaceae* (56 species), *Poaceae* (52 species), *Rosaceae* (43 species), *Ranunculaceae* (39 species). Species diversity: *Asteraceae* 22%; *Fabaceae* 17%; *Poaceae* 16%; *Rosaceae* 13%; *Ranunculaceae* 12%; *Brassicaceae* 7%; *Apiaceae* 7%; and *Scrophulariaceae* 6% from the total number of species growing with *P. ledebouriana*. Thus, a wide range of phytocenotic diversity with a high species richness has been identified in the limited territory of the Tarbagatai State National Park and its surroundings. The conservation and restoration of biological diversity is mostly ensured by the nature conservation status of the “Tarbagatai” State national park. The research results can be used for species identification and organization of conservation activities for the rare plant species *P. ledebouriana*.

Acknowledgments

The authors acknowledge the staff of the Tarbagatai State National Park represented by the General Director and employees of the Department of science, information and monitoring in the organization and conduct of the field research work within the framework of population studies on *Prunus ledebouriana* (Schltdl.) Y.Y. Yao on the territory of Tarbagatai ridge. Research was conducted within the framework of the project AP05131621 "Informational system for molecular genetic and botanical documentation of wild flora in Kazakhstan" 2018-2020 (CS MES RK IPBB).
